# **Co-Location of Medical and Dental Services Improves Access to Care**

### INTRODUCTION

- Geographic access to health care is associated with increased use of preventive improved health outcomes for certain chronic conditions.<sup>1,2,3,4,5,6,7</sup>
- 2. The association between proximity to healthcare facilities and improved diseas management and population health has been documented. Still, little is known area health care environments and how the presence of healthcare facilities h over time during recent health system and policy changes.<sup>8</sup>
- 3. Although geographic access is one of several components that can alter an inoverall access to healthcare, including insurance status, out-of-pocket costs, appointment wait times, and linguistic services, prior research has shown that geographic access is associated with greater use and improved outcomes.<sup>8</sup>

#### PURPOSE

To examine the rate of missed appointments for necessary pediatric dental care v and dental services were co-located in a single, convenient geographic location v two separate geographic locations.

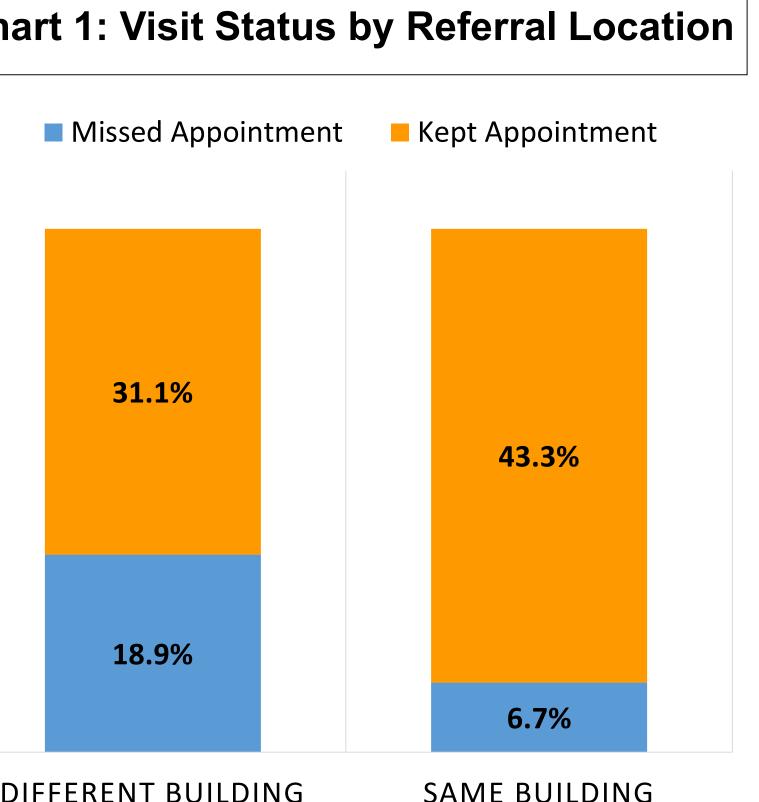

#### **METHODS**

A retrospective chart review was performed on randomly selected pediatric patien received medical and/or dental services at a rural community health center in Pitte Kansas during two four-month periods: prior to medical-dental co-location (Octobe January 2021) and after medical-dental co-location (October 2021 to January 202 and bivariate (Chi-square test) statistical analyses were performed to determine v association exists between missed appointments and service co-location.

Strength: Statistically significant differences with a p-value < 0.05 2. Strength: Demonstrates how important medical/dental integrations could be on appointment

3. Limitation: Retrospective nature of study cannot prove that decrease in missed appointment rates of integrated patients is directly due to integration

1. The rate of missed appointments was meaningfully and significantly reduced when medical and dental services were co-located at a single site within a rural community health center. 2. Increased understanding of reasons for missed appointment rates allows the dental office to operate efficiently and serve a greater number of patients within the community. 3. Further studies on medical-dental integration and geographic co-location may strengthen evidence-based practice and improve access to dental care in rural communities.
