# Impact of a Modular Bridge Course for First-Year Pharmacy Students

Rachael D. Baggett, PharmD; Dawn E. Havrda, PharmD\*; Chasity M. Shelton, PharmD\*; Karl Kodweis, PharmD\*; Sarka Beranova-Giorgianni, PhD\*\* The University of Tennessee Health Science Center, College of Pharmacy (UTHSC COP) \*Department of Clinical Pharmacy and Translational Sciences; \*\* Department of Pharmaceutical Sciences

### Background

- With fewer individuals and more diverse applicant pools, pharmacy programs have evolved to minimize barriers and promote student success.
- Programs have shifted towards promoting diversity by encouraging those with limited financial means or firstgeneration applicants.
- UTHSC COP wanted to address varying levels of baseline knowledge among incoming students and the impact of cognitive overload on student performance and stress.
- The Cognitive Load Theory was applied to create a bridge course for first-year (P1) students with the intent to level the knowledge gap and potentially identify earlier on the students at risk of struggling in the curriculum.

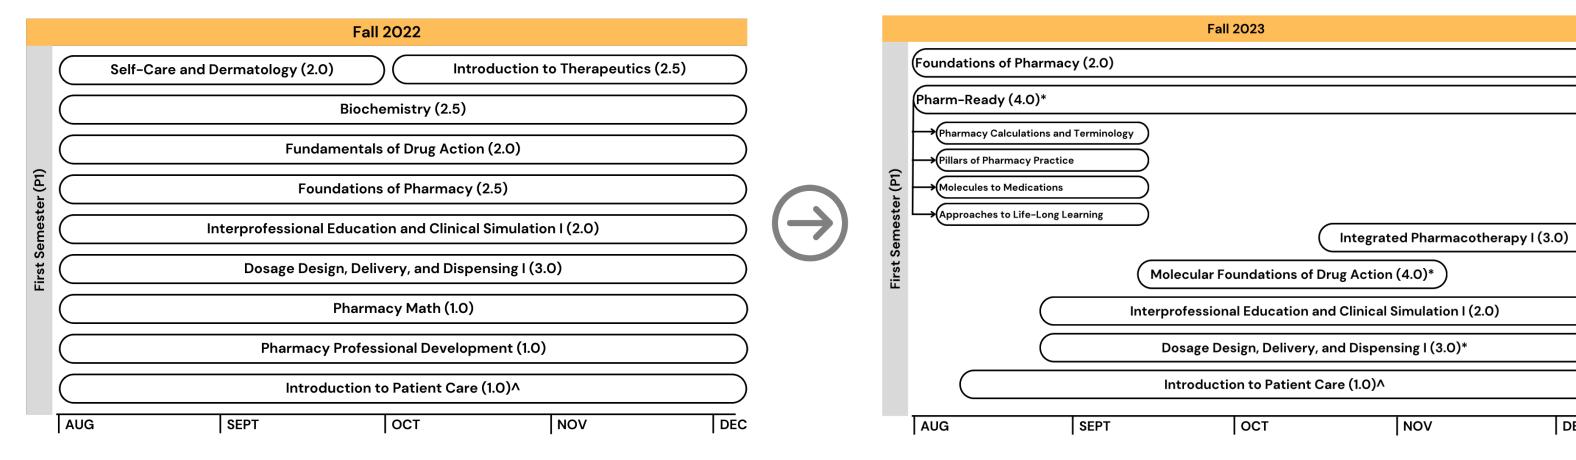

## **Objective**

To determine the short-term impact of a first-year pharmacy school (P1) curricular redesign on student performance in their first year.

### **Methods**

- Single-institution, retrospective cohort analysis comparing student outcomes for the P1 fall semester and P1 year between the classes of 2026 (fall 2022) and 2027 (fall 2023) after a curriculum redesign for the latter.
- An initial modular bridging course (Pharm-Ready) was introduced in the fall semester, followed by a fivecourse schedule (Figure 1). Remediation was instituted for individuals needing to achieve set competence.
- Data collected: student demographics (Table 1); undergraduate, fall term, spring term, and P1 year grade point average (GPA); P1 fall course performance; pre-matriculation math performance; remediation attempts; course final grade and grades earned less than a C-.
- Descriptive statistics were performed. The Chi-Square test compared categorical variables and Mann -Whitney for continuous variables. Risk estimates were measured. Significance was set at a p-value < 0.05.
- The study was approved as exempt from the UTHSC IRB.

### Results

### Table 1. First-year student demographic breakdown for both classes

Age, in years, mean (SD) Race, n (%) White Asian **Black** Mixed Other Unknown First generation, n (%) Yes No Prior degree, n (%) No Bachelor's degree Bachelor's degree or higher Pre-math assessment, mean (SD)

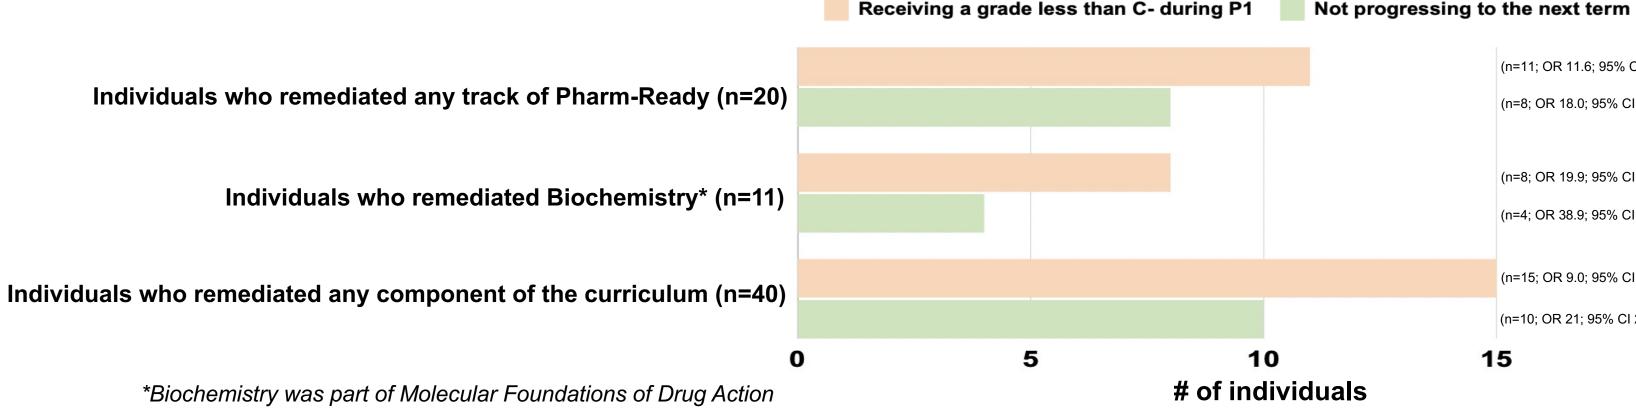

Undergraduate GPA, mean (SD)

#### Figure 2. Predicting student success during first-year of pharmacy program

## THE UNIVERSIT HEALTH

Major F	indings
---------	---------

- No difference in academic performance was found between the cohorts with the curricular redesign.
- The addition of the Pharm-Ready course increased the likelihood of first-generation and non-White students progressing to the P2 year.
- Regardless of the Pharm-Ready course, students with lower undergraduate GPAs or a pre-matriculation math score of <70% were more likely to receive a grade <Cand not progress to the P2 year.
- For the class of 2027, remediation attempts in Pharm-Ready and other courses significantly identified students who performed poorly and did not progress to the P2 year.

### Conclusions

- Adding a bridging course aided the transition to the PharmD program for first-generation and non-White students in terms of academic performance.
- Despite no difference in course performance, the need to remediate a portion of Pharm-Ready or biochemistry identified at-risk students for attaining a grade less than a C- or progressing in the curriculum.
- Pharm-Ready was predictive of students who would struggle, which can help with early identification of students at risk and intervention.
- Future directions are aimed at determining strategies to support at-risk students.
